Note – If this note is shared by any person or student then legal action will be taken against them . So all of you should not get influenced by anyone and should not share the notes .

It is not your right to ruin someone's hard work .

S-7 Pedagogy of Mathematics – 2 (Primary level)

UNIT - 01 Techniques and Resources for Teaching Mathematics

point -1 Mathematics teaching and constructivism

- According to constructivism, mistakes are necessary to learn anything because without mistakes nothing can be learned.
- Like when a child learns to ride a bicycle, he falls again and again but despite falling again and again, he gradually learns to ride a bicycle. That is why it is said that you can learn a lot even through mistakes.
- Mathematics has always been famous for its utility , importance, creativity and significance. One of the main goals of mathematics teaching and constructivist approach is -
- Teaching children how to learn math.
- The main objective of mathematics teaching in today's schools is to ' mathematize children's thinking ' .
- What are the main goals of mathematics teaching in schools ? In simple words, the answer is to mathematize the child's thought process.

❖ Constructivism has been given prominence in NCF-2005 and BCF-2008

- If there are such children in the classroom, then take them along because although the child will make mistakes again and again, but when you explain to him, he will learn and will be able to understand Mathematics easily.

❖ **Concepts of Mathematics Teaching**

- Mathematics is a group of sciences that studies numbers , quantities , magnitudes , forms and their mutual relationships, properties , nature etc.
- Mathematics is an abstract and deductive system.
- There are many branches of mathematics: - Arithmetic , Geometry, Trigonometry , Statistics , Algebra , Calculus etc.

❖ **Definition of Mathematics: -** The word ' Mathematics ' is very ancient and has been used extensively in Vedic literature.

- The literal meaning of the word mathematics is "where calculation is paramount."
- In this way, it can be said that mathematics is a system of short symbols like numbers , base , symbol etc. with the help of which we get the idea of quantity, direction and place.

❖ **concept of maths subject**

- Mathematics is such a subject whose teaching helps students practice irregularity and systematic work because unless the operations in mathematics are solved with rules and methods, the correct result is not obtained. Thus, mathematics develops the ability to work regularly and systematically in students.
1. Mathematics develops determination and confidence in students.
 2. The purity and impurity of truth or falsehood is checked only through mathematics.
 3. Through mathematics, students' mental , physical and spiritual development takes place.
 4. Mathematics creates self-reliance and self-confidence in students. This is why mathematics has such an important place in the curriculum.

5. Mathematics develops logical thinking in children

How to teach maths to kids:

- 1. Teach mathematics to children through various games and activities**
- 2. Teach mathematics to children by linking it with examples from daily life.**
- 3. While teaching mathematics, try to explain everything through the simplest examples so that children can understand.**
- 4. Give children the opportunity to think and solve questions on their own**
- 5. The teacher must understand the children understanding their background Only then will the concept of mathematics have to be explained.**
- 6. Before teaching Mathematics, a Mathematics teacher should know the concept of Mathematics and the nature of Mathematics. Only then can that Mathematics teacher impart effective teaching (Mathematics).**

❖ Objective of teaching mathematics:

- 1. To explain the methods of learning and teaching mathematics and the various aspects involved in it.**
- 2. different types of teaching learning materials Understanding requirements and usage.**
- 3. Understanding unit planning and learning plans.**
- 4. Understanding concepts related to geometric shapes and patterns.**
- 5. Understanding the need and use of fractions.**
- 6. Understanding operations on fractions.**
- 7. Interpretation of different types of fractions and decimals.**

❖ **Nature of Mathematics Teaching: -**

1. There are some objectives and structure for teaching every subject on the basis of which the nature of that subject is decided.
2. The structure of mathematics is more powerful than other subjects, so mathematics is more important than other subjects.
3. Every aspect of life is interrelated with mathematics.
4. Knowledge of mathematics helps a person to understand his own work.
5. Mathematics is directly related to measurement and weighing .
6. Without the knowledge of mathematics we cannot measure any area.
7. Other subjects have progressed only due to the knowledge of mathematics. Accurate measurement is inherent in the nature of mathematics and the validity of mathematics is completely reliable.

point - 2 A possible sequence of learning mathematics :-

- There is a possible sequence of learning mathematics which we call A-B-C-P.

1. A - Experience
2. Bha- language
3. chi-picture
4. Q – symbol

- ❖ **Experience: -** While teaching mathematics to children, if we make them experience some concrete objects , then the children learn faster. And when children experience things themselves, they learn about things very quickly.

- Like:- pebbles , wood , stones , pens etc.
- ❖ **Language : -** While teaching mathematics, mother tongue should be used so that children can learn mathematics easily. Because whatever is taught to children in their mother tongue is understood quickly.
 - Such as:- word/story, using questions , games etc.
- ❖ **Picture: -** When we teach mathematics by showing pictures that match the lesson , children learn well because children like to see pictures.
- ❖ **Sign :** While teaching mathematics, we teach many concepts to children through any number or symbol.
 - For example : - We can learn addition by showing pictures of houses.

Point -3 Teaching formal mathematics by linking it to concrete experiences:

1. Formal mathematics needs to be linked to concrete experiences so that children can understand things in a simpler way.
2. Even if they are able to do formal mathematics or calculations in their mind, children may still need real things and concrete experiences to understand concepts, operations , questions , etc.
3. Teaching formal mathematics means connecting it with concrete experiences ; this can be done through means like showing pictures, objects, conducting activities, etc.
 - For example:- Mathematics can be taught by showing objects , trees, plants , cows , flowers etc.

4. If children are not introduced to concrete experiences while teaching formal mathematics, then children face difficulty in learning mathematics. Therefore, children should be taught mathematics through all the mediums of concrete experiences.

➤ Example: - In a class, if we want to develop the understanding of numbers in a child, then we can develop the understanding of numbers by using concrete experiences. Like: - by showing a pen, through chocolate, a piece of stone etc.

❖ **Mathematic teach Of About In Some? And fact :**

1. teaching through games
2. learning by repetition
3. Children learn from each other.
4. learn from mistakes
5. learn by doing
6. learn through activities
7. Puzzles learn by

Point - 4 Teaching through games (Mathematics)

- game game In teach Enough Pleasure only Would Is with only with game game In learning From Life of Real Situation From Frost has to Is whose Reason Children More learning Are And it Learn Life Of For Enough useful Proven Would Is.
- game One Psychologist Method Is game In Children of natural There is interest and the game is enjoyable and interesting and the educational process gets accelerated through this method and Easy yes go Is
- Mathematics can be easily explained and taught through game method.
- Through game method, collective feeling, love, sympathy and social outlook is developed in the students.

- Teaching through game method helps in all-round development of students

Point - 5 Learning by repetition (Mathematics)

- Mathematic One Control learning wala Process Is whose Channel From every Area In every Place You Mathematic Of Importance And His Use To Know Are Because Mathematic Of Use Our It is considered quite useful in daily life
- The meaning of teaching mathematics by repetition is to learn about any task by doing it again and again, this is called repetition work , i.e., solve any equation in mathematics again and again and keep trying until you reach its correct meaning. If you persist, you will reach the correct answer; this process is called learning by repetition.
- For example: If a child does not know the multiplication table, then he writes the multiplication table again and again and memorises it and in the end he learns the multiplication table by repeating it.

Paint – 6 Children learn from each other (maths)

- Children One Others From learning Are Of Meaning Is That Only Mathematic only No Rather Any Too Thing Children each other To after seeing only learning Are whether He Mathematic yes Or Other Subject Yes , because the child goes to his society, his home, his family, lives in his neighborhood, he sees the rules and behavior there, so he learns by imitating them in the same way, he sees mathematical equations in his home, sees the uses of mathematics, sees the uses of

mathematics by other children, so there also the children learn mathematics by observing others.

- Children learn in a variety of ways – through experience , making and doing things , experimenting , reading , discussing , asking , listening , thinking, and expressing themselves through speech , movement or writing, both individually and with others . Kind From Them Our Development Of during These are needed for all kinds of occasions

Point 7 - Learn from mistakes (Mathematics)

- Any Too Work To to From First We Some? No Some? Mistake Do Are Then Mistake by only learning Are. Children If Any Mistake Do Are So Them Love From Explain. Them Tell me of Mistakes to do human being Everyone makes mistakes in life and learns and takes lessons from mistakes, so there is no need for you to panic .
- For example, when children count, they make mistakes like saying 18 after 15, 6 after 10, etc., but after being explained by the teacher, they start pronouncing correctly. So, here the child learns through mistakes only. People or children learn mathematics also through mistakes.

point – 8 Learning from activities -

- Activities We make them do this. Children learn very quickly and easily through activities. In this, children are given the opportunity to learn by doing it themselves, which makes them interested. Children are fully active in this. Through activities, we can give children information about small-big, inside-outside, high-low, less-big , far-near , light-heavy by connecting them to their daily life.

- As That You Know Are of action Of Channel From We Any Too Subject object To We can explain it in a better way, in the same way while studying Mathematics, we can tell the children about the concepts of Mathematics and the operations of Mathematics in a better way by conducting different types of mathematical activities.

point 9 Maths Puzzles –

- Mathematic In Riddles Of own Importance Is. Puzzles Pupils To Plough find Of For Inspired does riddles Of with One And Good talk it Is That This solving Time Students have to find the solution themselves. Solving puzzles develops the thinking power of students. Students get to know different ways to find solutions to problems. Many games and puzzles are also related to the subject of mathematics. I don't do it but I enjoy doing it like:- We will make a square by arranging the numbers 1 , 2 , 3 , 4 , 5 , 6 , 7 , 8 , 9. In this square, every number will be steep queue And horizontal queue In San Of The sum will be 15 Both Diagonal of Numbers Of horse will also be 15 ,

point - 10 open Question And issues -

1. : When children are asked oral questions in the class , it is called an open question.
2. Another name for open question is written question.
3. An open question is a question that has a long response.
4. The purpose of open-ended questions is to know children's opinions and their ideas.
5. Open-ended questions encourage children to answer the same question in different ways ,

6. Children's creative ability also increases through open-ended questions .
7. By asking open-ended questions, we get feedback from children and also know where we need to improve.
8. Open-ended questions are those questions that have multiple answers.

POINT – 11 Closed question :

1. Closed questions are those questions in which children have to answer in yes or no or in limited words.
2. which have a definite answer.
3. Which should be used to check understanding.

POINT – 12 Various resources for teaching and learning Mathematics :

1. Such means or equipments which help us in learning , main resources for learning are pictures , charts , object models , radio, TV, tape recorder etc.
2. Mathematics Laboratory , Mathematics Club , Mathematics Fair, TLM, ICT Experiments etc.
3. By using these resources, teaching becomes interesting and simple. With their help, we can explain complex concepts well. The teacher should also know how to use these resources.
4. There are many things around us that help us learn mathematics. Counting can be learnt using chocolates , pens , pencils , and pieces of stones.
5. We can learn to make circles using bangles.
6. Telling angles with small wooden pieces, making rectangles with copy , making cuboids with matchsticks , cones with ice-

cream Making a cone and a circle and cylinder can be explained from a round box.

7. Various geometric shapes can be made on paper.
8. To develop mathematical knowledge, it is important to use concrete experiences and resources.
9. TLM should also be used so that the mathematical teaching point concept can be made clear

Unit-02(Learning Planning and Assessment in Mathematics)

point – 1 plan to learn maths

- Learning plan in mathematics means presenting any lesson to the children in a simple and well-organised manner so that the children can read and understand it easily .
- The meaning of learning plan in mathematics is that when we want to read a lesson, before that we know all the things related to that lesson and how we have to present those things. For this we all make a plan that how we have to read which lesson and how to present it.
- Learning mathematics should be meaningful. Learning is meaningful when children have the opportunity to develop their understanding and can relate what they learn to their daily experiences.
- There is a definite order in which mathematics is learned. First it is necessary to work with concrete objects , then with pictures , and later with signs and symbols.

❖ While planning to teach mathematics to children, some things have to be kept in mind:-

1. Mathematic Learn One developing Process Is ,
2. Making a plan helps to clarify goals.

3. Planning ensures that all essential aspects of the subject matter are covered . Tax For Went Are.
4. By planning, time can be divided as per requirement.
5. Planning helps in keeping the children interested and attentive.
6. Planning can help avoid unnecessary repetition and get the required repetition done for practice.

❖ How to make a plan :-

1. The teaching sequence should match the children's development level.
2. Children should be provided with learning opportunities that help them develop their own understanding of mathematical concepts.
3. We should move forward based on what the children already know .
4. Children should have the opportunity to talk about mathematical concepts before and during learning them in written form

❖ One Ideal learning of Benefits of the scheme

1. learning of Plan Of By Subject matter To Sort of streamlined And can be taught effectively .
2. learning of Plan By Suitable And Effective Teaching It helps in deciding methods , techniques , activities, teaching aids and methods of assessment.
3. Its Use From Teacher revision From save Is And Time And Resources of Savings would have been Is.
4. Its By Pupils of Interest Enhance In Help meets Is And Subject matter Of Per Among them positive Attitude Of Development Would Is.

5. Its Use From Teaching - Learning Process In Pupils of Participation better would have been
6. Teachers In Self - confidence Of level growing Is So they are successful in achieving the set educational objectives.

❖ learning of Plan Ready to In various echelons

1. Topic
2. Review of prior understanding of the subject matter
3. Preparation of teacher's plan for the subject matter
4. self evaluation by the teacher
5. Observer's Comment

❖ Why make a plan

- This helps us organize our work with children, which encourages them to learn.
- Doing so also gives us the opportunity to focus on what we are doing . This generally increases our ability to teach.
- Planning helps make goals clear.
- Time for planning can be divided accordingly.
- Planning ensures that all aspects of the subject matter are covered.
- Planning helps to sequence the experiences needed for learning.
- Planning helps keep children interested and attentive.
- Planning increases the teacher's confidence and makes him happy in his work.

point - 2 maths Of Reference In learning Of assessment :-

1. Role of Assessment in Mathematics The main purpose of assessment is to collect information about learner's

achievement and progress and to provide direction for the ongoing teaching and learning process.

2. , skills and attitudes learnt by the students . This method is teacher-centred and the role of students is negligible in it. The teacher creates teaching-learning activities to find out what the students have learnt and what is yet to learn.
3. Assessment refers to the process that is done to measure the achievements of the learner. The main purpose of assessment is to inform the children about their educational progress and to improve their answers.
4. Assessment determines the extent to which the learner has confidence in his abilities
5. Difficulties in learning are identified through assessment. And appropriate solutions are also provided.
6. In the context of mathematics, when we assess a child inside the classroom , we come to know how much the child is able to understand and how much he is not able to understand. Only after that we change our teaching style because if we do not know the difficulties of the children, then we will not be able to solve their problems.

Example :- For example, if a child knows addition , subtraction , multiplication or division but is making mistakes while making calculations , we come to know about it through assessment. Children make these mistakes due to various reasons like lack of understanding of common numbers , lack of practice etc.

❖ **assessment Of Type** - Purpose Of On this basis , assessment can be broadly classified into three types.

1. Creative Assessment - when Any Teaching Process Own Initial Or Construction stage In yes And His assessment Tax in that

Improvement Did Go could So This Type Of assessment To creative assessment says

2. Summative Assessment - Summative assessment Of Use Tax Determined It is used at the end of any program , course or unit to know about students' knowledge , understanding , positive attitude , skills etc.

3. Diagnostic assessment- Diagnostic assessment is used to detect any kind of learning difficulty in students

point – 3 Continuous and Comprehensive Evaluation in context of Mathematics in Primary Care

- go on simultaneously . And its objective is to enable students to develop an understanding of teaching-learning process and to develop their own learning systems above and beyond their own methods.
- Continuous and comprehensive evaluation takes place both academically and semi -academically.
- Breastfeeding evaluation refers to regular and continuous assessment of breast size.
- entire teaching learning process assessment Of For Did go Is.
- Comprehensive Evaluation refers to the cognitive, emotional and cognitive aspects of the student.

❖ During continuous and comprehensive evaluation, the teacher assesses the following points in the class :-

1. observes the joint solution and communication skills of the children in the group.
2. Teachers observe which students are active and contributing to the conversation, and which students are not.

3. The teacher observes whether the children are trying to find possible solutions to the problem and whether they are trying to find the best solution among the possible solutions or not.
4. Teachers also do assessment through observation
5. Teachers assess how children are trying to collect data in different ways and whether they are using the appropriate method.
6. Teachers assess how children are organising the collected data.

point – 4 main techniques of assessment

1. **Examination technique:** In the examination technique, oral, written and practical examinations are taken. Both objective and essay type examinations can be conducted.
2. **Observation:-** Intellectual maturity of students and their social and emotional development is assessed through observation. This gives information about the habits and other skills developed in students.
3. **Ranking Scale:** The ranking scale measures the degree of development of any quality or ability in a student.
4. **Screening Lists -** Screening lists are assessments used to gain personal information and opinions.
5. **Items produced by students :-** Items produced by students refer to those items which are prepared by the students themselves.
6. **Interview:-** Knowledge of a person's problems and qualities can be obtained through an interview. An interview has a specific objective , oral conversation , interviewer and a person giving the interview.
7. **Obtained Marks Letter :** Obtained Marks Papers To many Functions Of Evaluation Of For Use Did go Is

point – 5 understanding learning symbols in mathematics

1. Indicators tell us how much knowledge and knowledge the child has acquired so far. Indicators also tell us the direction of the child's progress. Along with this, teaching - learning Process Correct Direction In Ambulatory doing Is Or No , this is known to us by the indicator.
2. Assessment and evaluation determine whether the child is learning mathematics in the class or not. If the child is learning, then the understanding of mathematics is developing in the child.

❖ Mathematic learning - teaching of Process In Indicator Importance of :-

- learning - teaching of Process In learning of Continuity To Attention In keeping happened Children To Sakhine of better Understanding And Him Centre In Keeping Of For Indicator very Are important .
- Indicator Children of learning of Competencies assessment to Of For One framework provide does Is.
- Indicator These serve as reference points for parents , children and others to easily understand the progress of children, what are the concepts in Mathematics that their child has learnt or is learning at this stage.

Unit -3 Geometrical Shapes And Pattern

point - 1 open and closed , regular and irregular shapes

- Mathematic Subject Of Class Three Of One Teacher From it ask But That They Children To Close And open Shapes From How Introduction Karate yes . he told That They Children of Picture create of Capacity Of Here abundant Use Do Are. their Tell

Was That First They Children From Very From different - different Picture We ask them to draw them. Then we draw some of their selected pictures on the board and introduce them to closed and open shapes, regular and irregular shapes.

➤ As. 

- **open Shape** , Who Shape That Point From Start through That same Point But it does not end , it is called an open figure.
- Shapes that do not end at their starting point , i.e., start from one point and end at another point , are called open shapes.

E.g. :- 3. A, C,

❖ **closed shape:-** The figure which starts from a certain point and ends at the same point is called a closed figure.

- Close Shape Of Initial Point and last point One only Would Is. Like :- 0 , 

❖ **Regular And irregular Shapes**

- Gin Shapes To geometrical Sizes In can be divided , they are called regular shapes .
- Such Shapes whose All Who? And arm Similar would have been Is. That is arms of Length And Shapes In Becoming ones angle Similar would have Are. Regular Shape says Is.
- Like quadrilateral, triangle, circle etc.

❖ **irregular Shapes -**

- Shapes To geometrical Sizes In Divided No Tax Can Yes , they are called irregular shapes.
- Shapes whose side lengths and angles formed in the shapes are not equal are called irregular shapes.

As:-

point – 2 point-line , ray , line segment and angle

❖ **Point (Print) :**

- A point is a shape which has no length , width or thickness. A point is used to represent a particular position. The position of a point is fixed. For example:-
- Needle of A nail , a pen tip , a compass tip and the stars in the sky appear like a point, but we cannot know its length , breadth or thickness .

❖ **Rekha (line) : -** A line that continues to infinity in both directions is called a line.

- Line In Width And There is no thickness , it only has length.
- This Both on the side Arrow Of Mark From reflecting Is. 

❖ **Ray :** it is from a point It starts and goes in the same direction to the end. It has a starting point.

Ex- torch light , sun ray

❖ **Line segment ,** The minimum distance between two points that can be measured is called a line segment .

- A line segment has no width and only length.
- A line segment has two endpoints.
- AB 

❖ **Line Of Type**

1. Easy Line AB 

2. Parallel line 

3. Sangami Line

4. Curve line 

5. Ray Line

6. transversal

7. Perpendicular line

❖ Angle :

- The inclination between two rays is called a ray.
- If Any Line Our One ends To steady By placing spinning Hui Own Situation In Change does , then the measure of revolution of the line is called the angle .
- angle Of Symbol – **L**

❖ angle Of Type

1. Zero angle = An angle whose measure is 0° .
2. Acute angle = an angle whose measure is greater than 0° Should be less than 90° .
3. Right angle = An angle whose measure is 90° .
4. Obtuse angle = An angle whose measure is greater than 90° and less than 160° .
5. straight angle = an angle whose measure is 180°
6. Reciprocal angle = Angle whose measure is greater than 180° And it is less than 360° .
7. Complete angle = An angle whose measure is 360° .

point – 4 D-forming and three-dimensional shapes

- ❖ Two - dimensional size :- In geometry , a two-dimensional figure is a plane figure or a figure that has only two dimensions. namely length and width.
- Two-dimensional (2D) shapes do not have thickness and can only be measured from two sides.

- 2D - only area and perimeter of the shape Calculations of Go can Is. Like- O ,

- Rectangle , Square , triangle , Circle , etc.

❖ **three dimensional Shapes :** - A three dimensional shape has three dimensions such as length, width , thickness. Its volume , curved surface area and total surface area can be calculated.

- Like - money , Dhannath , ball , cylinder , enemy etc.
- cube , sphere , cylinder, etc.

point – 5 symmetrical Shapes - When two shapes are equal Divided into parts If it happens then it is called a symmetrical figure.

- If the shapes are folded in such a way that they look the same from all directions and match each other in every way, they are called symmetrical shapes.
- Leaves of trees , walls of house , classroom notebooks , etc.

point – 6 pattern of concept

- Mathematic In , a pattern is a repeated arrangement of numbers , shapes , colours etc.
- The concept of pattern means that when we follow a sequence to solve any question, it is called a pattern.
- Like :- 2,4 , --- , 8 , ---- , 12 ,

Unit - 04 Fractions and Decimal Numbers

point - 1 Understanding fractional numbers and their use in daily life

- ❖ **Fraction :** A fraction is a number that divides a whole into several parts. This whole can be a single object or a group of objects. For example

1. Full Part - 1
2. Half - $\frac{1}{2}$
3. One third part- $\frac{1}{3}$
4. $\frac{1}{4}$ of a quarter

❖ a fraction has two parts

- (1) Numerator (2) Denominator

❖ Different Of Type :- Variants Of Following Part would have Is

- ❖ **Even Different :-** When Any Different Of Part His every From Less Would , then it is called an even fraction.

Like- $\frac{2}{800}$, $\frac{3}{16}$, $\frac{4}{8}$, $\frac{5}{11}$

- ❖ **Odd Different :-** When Any Different Of Part Of Value His every Of Value From More Would Is. So Him Odd Different says Are.

Like- $1\frac{7}{5}$, $\frac{18}{2}$, $\frac{12}{6}$, $1\frac{0}{4}$

- ❖ **Mixture Different :-** Such Different Of Two Part would have , one part is a whole number , And the second one is even and different.

- A fraction which is made up of an integer and an even fraction, i.e. whose numerator and denominator are written along with an integer. \
- For example - 5 integers $\frac{1}{4}$, 6 integers $\frac{3}{5}$, 7 integers $\frac{8}{9}$

❖ **Homogeneous Different :-** Homogeneous Different Of every Similar would have been Is.

Like- $\frac{2}{4}$, $\frac{5}{4}$, $\frac{6}{4}$, $\frac{8}{4}$

❖ **Unlike Fractions :-** Denominators of unlike fractions are unequal

Like- $\frac{5}{3}$, $\frac{2}{8}$, $\frac{1}{7}$, $\frac{5}{8}$]

❖ **Daily Life In Different Of Use :-**

- Our Daily Life In Different Of Specific Importance Is. Any Too small - big Calculations We Different Of By only Do Are. Any Too Group Of Parts To taking Him Calculations to In Different Of Use Would Is. Any Too Fractions are used in weighing things equally and in buying any item from a shop. Fractions are used in publishing exam results. We use fractions to express division questions.

point – 3 different of Mathematical Operations :

1. Addition of Fractions :
2. Subtraction of Fractions
3. rule of multiplication of fractions
4. rule of division of fractions
5. Fractions as Ratios
6. Fractions as Measurement

point – 4 Decimal numbers and decimal fractions

❖ **Decimal Number :-** That Number In put decimal place (.) Would Is.

- Decimal numbers are used to find the average of numbers.
- Decimal (.) is a symbol to write mathematical numbers. It can be written as a fraction.
- Like :- $0.70 = \frac{7}{100}$ $6.5 = \frac{65}{10}$

❖ **Decimal Different :** If the denominator of a fraction is 10 , there is a value of 40 and it is written in decimal system , then that fraction is called decimal

- A simple fraction whose denominator is ten or any power of ten is called a decimal fraction.
- E.g. :- $7/10 = 0.7$, $9/100 = 0.09$

point – 5 decimal Numbers of Mathematic operations

1. Addition of Decimal Numbers
2. Calculation of decimal numbers
3. Multiplication of Decimal Numbers
4. Division of Decimal Numbers

point - 6 written questions and types

1. word question The question is like an open question.
2. In this, oral questions are asked from the children.
3. Children find written questions difficult.
4. Written questions should always be given to children by linking them with daily life so that children can solve them easily.
5. Before solving a word problem, children should understand the problem

❖ Daily Life In Different And Decimal Different

1. to divide something into pieces We use fractions for .
2. Do not use fractions to measure the hardness of jewellery. Do not use fractions while cooking food items.
3. The use of fractions is also seen in the fields.
4. Decimals are used to add and subtract money and rupees.

5. In daily life, decimals are used while buying goods (food). For example: 25 kg. 1.5 kg etc.

THANK YOU SO MUCH

TEAM – FUTURE ONLINE CLASSES SONPUR

future online classes sonpur
